

IN THE CLAIMS

1. (Original) A method of conducting R chemical reactions, where $R > 1$, in a system which includes an apparatus which provides energy for the chemical reactions, said system also including a parameter selecting unit having a user interface and storage means for carrying a database, said chemical reaction involving one or more chemical species XB and resulting in a reaction product XD which includes a functionality δ , where the chemical reaction involves one or more functionalities β in the XB 's which are transformed into δ in XD , each reaction being performed under the influence of one or more corresponding chemical substances A_R , such chemical substances A_R including a chemical functionality α_R being involved in the transformation of the functionality/functionalities β to the functionality δ , said database comprising N sets of associated data, each of the N sets comprising

- i) a set of reaction parameters for a chemical reaction involving the transformation of one or more functionalities $^N\beta$ of chemical species NB into $^N\delta$ in a product ND under the influence of one or more chemical substances NA , such chemical substance(s) each including a chemical functionality $^N\alpha$ being involved in the transformation of the functionality $^N\beta$ to the functionality $^N\delta$; and
- ii) functional or structural information about the chemical species NB ;

the method comprising that

* the user provides information to the user interface of the parameter selection unit about the functionality/functionalities β in the chemical species XB ;

* the user provides information to the user interface of the parameter selection unit about the desired transformation of β to δ ;

* the parameter selection unit retrieves R sets of associated data (Σ_R) from the database, such sets of associated data being selected so that the functionality/functionalities $^N\beta$ in each set of associated data is/are essentially identical to the functionality/functionalities β in XB and the functionality $^{MN}\delta$ is essentially identical to δ in the product XD , in order to obtain the R sets of reaction parameters ($^X\Sigma_R$), said R sets of reaction parameters ($^X\Sigma_R$) being accompanied by corresponding information about the chemical substance(s) A_R under which influence the R reactions should be conducted and information about any additional constituents involved in the chemical reaction;

 * an array of R reaction mixtures each comprising a predetermined amount of the chemical substance(s) A_R and the chemical species XB and any additional constituents required is prepared according to the sets of reaction parameters;

* each of the R reaction mixtures are treated in the apparatus in accordance with the corresponding set of reaction parameters.

2. (Original) A method according to claim 1, wherein the array of R reaction mixtures is provided from XB stock solution(s) and a kit comprising stock solutions of the chemical substance(s) A_R and any additional constituents required.

3. (Original) A method according to claim 1, wherein the R sets of reaction parameters involves the use of more than one chemical substance A_R .

4. (Original) A method according to claim 1, wherein the R sets of reaction parameters involves the use of R chemical substances A_R .

5. (Original) A method according to claim 1, in which the array of R reaction mixtures is prepared by combining the chemical species XB with the content of one or more of P containers each comprising a chemical substance A_R including a chemical functionality α_R which is intended to facilitate the transformation of a functionality β to a functionality δ in a chemical reaction involving a chemical species XB .

6. (Original) A method according to claim 1, wherein the R sets of reaction parameters are provided in the form of control parameters for the apparatus.

7. (Original) A method according to claim 1, wherein treatment of the R reactions is performed substantially simultaneously.

8. (Original) A method according to claim 1, wherein treatment of the R reactions is performed sequentially.

9. (Original) A method according to claim 1, wherein the treatment includes heating.

10. (Original) A method according to claim 1, wherein the reaction is a microwave facilitated chemical reaction.

11. (Original) A method according to claim 1, wherein the apparatus comprises a microwave reaction cavity.

12. (Original) A kit for use in the method defined in claim 1, said kit comprising P containers each comprising a chemical substance A_R including a chemical functionality α_R which is intended to facilitate the transformation of one or more functionalities β to a functionality δ in a chemical reaction involving one or more chemical species XB , said chemical reaction being intended to result in a reaction product XD which includes a functionality δ , where the chemical reaction involves one or more functionalities β in the XB 's which are transformed into δ in XD .

13. (Original) A kit according to claim 12, which further comprises additional constituents required for the transformation.

14-16 (cancelled)

17. (New) A kit comprising P containers each comprising a chemical substance A_R including a chemical functionality α_R which is intended to facilitate the transformation of one or more functionalities β to a functionality δ in a chemical reaction involving one or more chemical species XB , said chemical reaction being intended to result in a reaction product XD which includes a functionality δ , where the chemical reaction involves one or more functionalities β in the XB 's which are transformed into δ in XD , said kit usable to conduct R chemical reactions, where $R > 1$, in a system which includes an apparatus which provides energy for the chemical reactions, said system also including a parameter selecting unit having a user interface and storage means for carrying a database, said chemical reaction involving one or more chemical species XB and resulting in a reaction product XD which includes a functionality δ , where the chemical reaction involves one or more functionalities β in the XB 's which are transformed into δ in XD , each reaction being performed under the influence of one or more corresponding chemical substances A_R , such chemical substances A_R including a chemical functionality α_R being involved in the transformation of the functionality/functionality β to the functionality δ , said database comprising N sets of associated data, each of the N sets comprising

- i) a set of reaction parameters for a chemical reaction involving the transformation of one or more functionalities $^N\beta$ of chemical species NB into $^N\delta$ in a product ND under the influence of one or more chemical substances NA , such chemical substance(s) each including a chemical functionality $^N\alpha$ being involved in the transformation of the functionality $^N\beta$ to the functionality $^N\delta$; and

ii) functional or structural information about the chemical species ${}^N\text{B}$;

the method comprising that

* the user provides information to the user interface of the parameter selection unit about the functionality/functionality β in the chemical species ${}^X\text{B}$;

* the user provides information to the user interface of the parameter selection unit about the desired transformation of β to δ ;

* the parameter selection unit retrieves R sets of associated data (Σ_R) from the database, such sets of associated data being selected so that the functionality/functionality ${}^N\beta$ in each set of associated data is/are essentially identical to the functionality/functionality β in ${}^X\text{B}$ and the functionality ${}^{MN}\delta$ is essentially identical to δ in the product ${}^X\text{D}$, in order to obtain the R sets of reaction parameters (${}^X\Sigma_R$), said R sets of reaction parameters (${}^X\Sigma_R$) being accompanied by corresponding information about the chemical substance(s) A_R under which influence the R reactions should be conducted and information about any additional constituents involved in the chemical reaction;

* an array of R reaction mixtures each comprising a predetermined amount of the chemical substance(s) A_R and the chemical species ${}^X\text{B}$ and any additional constituents required is prepared according to the sets of reaction parameters;

* each of the R reaction mixtures are treated in the apparatus in accordance with the corresponding set of reaction parameters.

R1

18. (New) A kit according to claim 17, which further comprises additional constituents required for the transformation.

19. (New) A computer readable data carrier loaded with a computer program system, said computer program system

* retrieving information via the user interface of the parameter selection unit about the functionality/functionalities β in the chemical species XB ;

* retrieving information via the user interface of the parameter selection unit about the desired transformation of β to δ ;

 * retrieving, via the parameter selection unit, R sets of associated data (Σ_R) from the database, such sets of associated data being selected so that the functionality/functionalities ${}^N\beta$ in each set of associated data is/are essentially identical to the functionality/functionalities β in XB and the functionality ${}^{MN}\delta$ is essentially identical to δ in the product XD , in order to obtain the R sets of reaction parameters (${}^X\Sigma_R$), said R sets of reaction parameters (${}^X\Sigma_R$) being accompanied by corresponding information about the chemical substance(s) A_R under which influence the R reactions should be conducted and information about any additional constituents involved in the chemical reaction;

* providing instructions to the liquid handler about the preparation of an array of R reaction mixtures each comprising a predetermined amount of the chemical substance(s) A_R and the chemical species XB and any additional constituents required according to the sets of reaction parameters;

* providing instructions to the reaction cavity about treatment of each of the R reaction mixtures in the apparatus in accordance with the corresponding set of reaction parameters in order to conduct R chemical reactions, where $R > 1$, in a system which includes an apparatus which provides energy for the chemical reactions, said system also including a parameter selecting unit having a user interface and storage means for carrying a database, said chemical reaction involving one or more chemical species XB and resulting in a reaction product XD which includes a functionality δ , where the chemical reaction involves one or more functionalities β in the XB 's which are transformed into δ in XD , each reaction being performed under the influence of one or more corresponding chemical substances A_R , such chemical substances A_R including a chemical functionality α_R being involved in the transformation of the functionality/functionality β to the functionality δ , said database comprising N sets of associated data, each of the N sets comprising

- i) a set of reaction parameters for a chemical reaction involving the transformation of one or more functionalities $^N\beta$ of chemical species NB into $^N\delta$ in a product ND under the influence of one or more chemical substances NA , such chemical substance(s) each including a chemical functionality $^N\alpha$ being involved in the transformation of the functionality $^N\beta$ to the functionality $^N\delta$; and
- ii) functional or structural information about the chemical species NB ;

the method comprising that

* the user provides information to the user interface of the parameter selection unit about the functionality/functionality β in the chemical species XB ;

* the user provides information to the user interface of the parameter selection unit about the desired transformation of β to δ ;

* the parameter selection unit retrieves R sets of associated data (Σ_R) from the database, such sets of associated data being selected so that the functionality/functionality $^N\beta$ in each set of associated data is/are essentially identical to the functionality/functionality β in XB and the functionality $^{MN}\delta$ is essentially identical to δ in the product XD , in order to obtain the R sets of reaction parameters ($^X\Sigma_R$), said R sets of reaction parameters ($^X\Sigma_R$) being accompanied by corresponding information about the chemical substance(s) A_R under which influence the R reactions should be conducted and information about any additional constituents involved in the chemical reaction;

R * an array of R reaction mixtures each comprising a predetermined amount of the chemical substance(s) A_R and the chemical species XB and any additional constituents required is prepared according to the sets of reaction parameters;

* each of the R reaction mixtures are treated in the apparatus in accordance with the corresponding set of reaction parameters.
